53. A network has a data transmission bandwidth of $20 \times 10^6$ bits per second. It uses CSMA/CD in the MAC layer. The maximum signal propagation time from one node to another node is 40 microseconds. The minimum size of a frame in the network is __________ bytes.

Answer: (200)
54. For the IEEE 802.11 MAC protocol for wireless communication, which of the following statements is/are TRUE?

   I. At least three non-overlapping channels are available for transmissions.
   II. The RTS-CTS mechanism is used for collision detection.
   III. Unicast frames are ACKed.

   (A) All I, II, and III  (B) I and III only
   (C) II and III only   (D) II only

   Answer: (B)

55. Consider a $128 \times 10^3$ bits/second satellite communication link with one way propagation delay of 150 milliseconds. Selective retransmission (repeat) protocol is used on this link to send data with a frame size of 1 kilobyte. Neglect the transmission time of acknowledgement. The minimum number of bits required for the sequence number field to achieve 100% utilization is ________.

   Answer: (4)
