In an adjacency list representation of an undirected simple graph $G = (V, E)$, each edge $(u, v)$ has two adjacency list entries: $[v]$ in the adjacency list of $u$, and $[u]$ in the adjacency list of $v$. These are called twins of each other. A twin pointer is a pointer from an adjacency list entry to its twin. If $|E| = m$ and $|V| = n$, and the memory size is not a constraint, what is the time complexity of the most efficient algorithm to set the twin pointer in each entry in each adjacency list?

48. Consider the following two-process synchronization solution

Process 0

--------
Entry: loop while (turn == 1); (critical section)
Exit: turn = 1;

Process 1

Exit: turn = 0;

(A) This is a correct two-process synchronization solution.  
(B) This solution violates mutual exclusion requirement.  
(C) This solution violates progress requirement.

The largest initial value of $S$ for which at least one $P(S)$ operation will remain blocked is __________.

The latency to read a block from the cache is 1ms and to read a block from the disk is 10ms. Assume that the cost of checking whether a block exists in the cache is negligible. 54. For the IEEE 802.11 MAC protocol for wireless communication, which of the following statements is/are TRUE?

I. At least three non-overlapping channels are available for transmissions.
II. The RTS-CTS mechanism is used for collision detection.
III. Unicast frames are ACKed.

(A) All I, II, and III  (B) I and III only  (C) II and III only  (D) II only

55. Consider a $128 \times 10^3$ bits/second satellite communication link with one way propagation delay of 150 milliseconds. Selective retransmission (repeat) protocol is used on this link to send data with a frame size of 1 kilobyte. Neglect the transmission time of acknowledgement. The minimum number of bits required for the sequence number field to achieve 100% utilization is _________.

Key: (4)

Exp: $B = 128 \text{ kbps}$

$T_p = 150\text{ ms}$

$L = 1\text{ KB}$

$\eta = 100\% \Rightarrow 1 = \frac{w}{1 + 2a}$

$T_x = \frac{L}{B} = \frac{8 \times 10^3}{128 \times 10^3} = 62.5\text{ ms}$

$a = \frac{T_p}{T_x} = \frac{150\text{ ms}}{62.5\text{ ms}} = 2.4$

$\Rightarrow w = 1 + 2a \Rightarrow \frac{2^n}{2} = 1 + 2(2.4) \Rightarrow \frac{2^n}{2} = 5.8 \Rightarrow 2^n = 11.65$

$\Rightarrow 2^n = 11.6 = 12 = 2^4$

$n = 4$
